

VCell

modeling environment for
mathematical simulation of
cellular events.

To run VCell go to:

vcell.org

Virtual Cell is developed by the Center for Cell Analysis and Modeling at the University of Connecticut Health Center. It is funded as a Biomedical Technology Research Resource by the National Institute of General Medical Sciences (NIGMS)

VCell Tutorial

PH-GFP binding to PIP₂ and IP₃

Create a biomodel and 3D spatial (PDE) application to simulate pleckstrin homology domain (PH-GFP) reporter for conversion of PIP₂ to IP₃.

In this tutorial...

- Create a BioModel with reactions involving membrane and volume species.
- Create a compartmental (ODE) application that uses events to include time-dependent triggers.
- Create a spatial deterministic (PDE) application of a model using analytic equations to create a 3D geometry
- Define initial concentrations that are non-uniform in space and create timed events in spatial models using Boolean expressions
- Create output functions for more complex analysis of simulation results, e.g. to sum all fluorescent species in a compartment.

Delete More Copy Actions ▾ Compare... Search

Items (0 Errors, 0 Warnings)

e.g. species, reaction, simulation) to view/edit properties.

The screenshot displays the VCell software interface. On the left is a sidebar with a tree view of model components under 'PH-GFP':

- Physiology
 - Reaction Diagram
 - Reactions (3)
 - Structures (5)
 - Species (6)
 - Molecules (0)
 - Observables (0)
- Applications (1)
 - Steady State
- Parameters, Functions and Units
- Pathway
- Scripting

The main window shows a table with the following data:

Name	Math Type	Annotation
d/dt Steady State	explicit network model, compartmental, determ...	

A red box highlights the 'Steady State' entry in the 'Name' column. A yellow callout box points to it with the text: "Double click 'Application0' under the Name column. Type in 'Steady State'. Press 'Enter' on your keyboard to finalize."

Below the table is a toolbar with buttons: "New Application", "Delete", "More Copy Actions", "Compare...", and "Search".

At the bottom, the "Object Properties" panel shows "Problems (0 Errors, 0 Warnings)" and a message: "Select only one object (e.g. species, reaction, simulation) to view/edit properties."

Double click "Application0" under the Name column. Type in "Steady State". Press "Enter" on your keyboard to finalize.

In this first Application we determine steady state levels using a compartmental geometry (ODE), with similar compartment sizes as a 3D spatial geometry (PDE) used in a second Application, given starting concentrations for IP3 and PH-GFP and starting membrane density of PIP2. ODEs can be solved much faster than PDEs; the results of this Application can be used as the initial conditions of the spatial Application

Select "Steady State" and click on the "Specifications" > "Species" tabs

Add Function Delete Function

Name	Expression	Defined In

Type "fluorescence" for the Function Name.

Add Output Function

Function Name Fluorescence

Function Expression $IP3_PHGFP_Cyt+PH_GFP_Cyt$

Next >> Cancel

Type "IP3_PHGFP_Cyt+PH_GFP_Cyt" for the Function Expression. This function allows you to look at the sum of all the different species that contribute to the fluorescence signal.

Click "Next >>".

Note that species names are case sensitive
